ART UNIT 2416		PAPER NUMBER		
MAIL DATE 04/01/2009		DELIVERY MODE PAPER		

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

### Office Action Summary

**Application No.**

10/721,399

**Applicant(s)**

BACCELLI ET AL.

**Examiner**

SYED BOKHARI

**Art Unit**

2416

**Period for Reply** -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 29 January 2009.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 1-4, 7-15 and 18-22 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-4, 7-15 and 18-22 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

#### Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO/SB-08)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

## DETAILED ACTION

### *Response to Amendment*

1. Applicant's amendment filed on January 29<sup>th</sup>, 2009 has been entered. Claims 1 and 12 have been amended. Claims 1-4, 7-15 and 18-22 are pending in the application.

### *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

4. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was

not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

5. Claims 1-2, 4, 10, 12-13, 15 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over McCanne (2003/0088696 A1) in view of Haas et al. (7,035,937 B2) and further in view of O'Toole et al. (US 7,185,077 B1).

McCanne discloses a communication system with overlay protocol to route information according to overlay routing table with the following features: regarding claim 1, a computer implemented method for group communication over a network of processors comprising (Fig. 1, overlay router arrangement, see "overlay routing processors" recited in paragraph 0012 line 1-10), determining an overlay spanning tree comprising (Fig. 1, overlay router arrangement, see "source to active receivers" recited in paragraph 0050 line 8-10), an origin node and at least one receiving node (Fig. 1, overlay router arrangement, see "source to active receivers" recited in paragraph 0045 line 1-5), wherein determining the configuration of the overlay spanning tree comprises defining a target bandwidth less than a maximum link bandwidth of the edges of the overlay spanning tree given a fully connected overlay distribution graph (Fig. 1, overlay router arrangement, see "overlay routers with application level knowledge, carry out transformation conditioned on bandwidth constraints" recited in paragraph 0033 line 12-17), increasing the target bandwidth upon

determining that the configuration of the overlay spanning tree is constructible based on the current overlay distribution graph (Fig. 1, overlay router arrangement, see “the plugin could forward the maximum number of streams that the bandwidth policy permits” recited in 0109 lines 3-9) and decreasing the target bandwidth upon determining that the configuration of the overlay spanning tree is not constructible based on the current overlay distribution graph (Fig. 1, overlay router arrangement, see “the plugin might perform stream thinning within the network according to bandwidth throughput” recited in paragraph 0109 lines 1-3), with no edge having a bandwidth below the target bandwidth (Fig. 1, overlay router arrangement, see “improves the routing by reducing the path lengths from a given LVIF that may be connected to external network” recited in paragraph 0062 lines 1-14 and paragraph 0065 line 1-13) and controlling a source communication rate between the origin node and at last the one receiving node to be less than or equal to a bottleneck rate of the overlay spanning tree having a selected configuration (Fig. 1, overlay router arrangement, see “flow in a bandwidth managed system” recited in paragraph 0047 lines 1-11); regarding claim 4, further comprising scaling the overlay spanning tree to an arbitrary group size (Fig. 2, processing and management, see “multipoint infrastructure transport protocol” recited in paragraph 0049 lines 7-10 and paragraph 0050 lines 1-7); regarding claim 12, a program storage device readable by machine, tangibly embodying a program of instructions executable by the machine to perform (Fig. 1, overlay router arrangement, see “overlay routing processors” recited in 0012 line 1-4), method steps for group communication over a network of processors, the method steps comprising: determining

an overlay spanning tree comprising (Fig. 1, overlay router arrangement, see “instruction for overlay group” recited in 0012 line 4-10), determining an overlay spanning tree comprising (Fig. 1, overlay router arrangement, see “source to active receivers” recited in paragraph 0050 line 8-10), an origin node and at least one receiving node (Fig. 1, overlay router arrangement, see “source to active receivers” recited in paragraph 0045 line 1-5), wherein determining the overlay spanning tree comprises defining a target bandwidth less than a maximum link bandwidth of edges of the overlay tree given a fully connected overlay distribution graph (Fig. 1, overlay router arrangement, see “overlay routers with application level knowledge, carry out transformation conditioned on bandwidth constraints” recited in paragraph 0033 line 12-17), increasing the target bandwidth upon determining that the overlay spanning tree is constructible based on the current overlay distribution graph (Fig. 1, overlay router arrangement, see “the plugin could forward the maximum number of streams that the bandwidth policy permits” recited in 0109 lines 3-9) and decreasing the target bandwidth upon determining that the configuration of the overlay spanning tree is not constructible based on the current overlay distribution graph (Fig. 1, overlay router arrangement, see “the plugin might perform stream thinning within the network according to bandwidth throughput” recited in 0109 lines 1-3) and controlling a source communication rate between the origin node and at least one receiving node to be less than or equal to a bottleneck rate of the configuration of the overlay spanning tree based on the reduced overlay distribution graph (Fig. 1, overlay router arrangement, see “flow in a bandwidth managed system” recited in paragraph 0047 lines 1-11) and regarding claim 15, further

comprising scaling the overlay spanning tree to an arbitrary group size (Fig. 2, processing and management, see “multipoint infrastructure transport protocol” recited in paragraph 0049 lines 7-10 and paragraph 0050 lines 1-7).

McCanne does not disclose the following features: regarding claim 1, determining a configuration of the overlay spanning tree having a maximum throughput among all possible configurations of the spanning tree, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth and until the configuration of the overlay spanning tree has the maximum throughput; regarding claim 2, further comprising protecting data delivery by link error recovery; regarding claim 10, further comprising redetermining the spanning tree upon determining that an existing node has left the spanning tree; regarding claim 12, determining a configuration of the overlay spanning tree having a maximum throughput among all possible configurations of the spanning tree, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth and until the configuration of the overlay spanning tree has the maximum throughput; regarding claim 13, further comprising protecting data delivery by link error recovery and regarding claim 21, further comprising redetermining the spanning tree upon determining that an existing node has left the spanning tree.

Haas et al. discloses a communication system offering independent tree ad hoc multicast routing with the following features: regarding claim 1, determining a configuration of the overlay spanning tree having a maximum throughput among all possible configurations of the spanning tree given a reduced overlay distribution tree (Fig. 1, spanning tree, see "computing maximally independent trees" recited in column 7 lines 53-60) and until the configuration of the overlay spanning tree has the maximum throughput (Fig. 1, spanning tree, see "computing maximally independent trees" recited in column 7 lines 60-67); regarding claim 2, further comprising protecting data delivery by link error recovery (Fig. 1, spanning tree, see "calculate backup trees" recited in column 5 lines 20-31); regarding claim 10, further comprising redetermining the spanning tree upon determining that an existing node has left the spanning tree (Fig. 1, spanning tree, see "computes alternating routing trees or paths" recited in column 2 lines 59-67 and column 3 lines 1-4); regarding claim 12, determining a configuration of the overlay spanning tree having a maximum throughput among all possible configurations of the spanning tree (Fig. 1, spanning tree, see "computing maximally independent trees" recited in column 7 lines 53-60); regarding claim 13, further comprising protecting data delivery by link error recovery (Fig. 1, spanning tree, see "calculate backup trees" recited in column 5 lines 20-31) and regarding claim 21, further comprising redetermining the spanning tree upon determining that an existing node has left the spanning tree (Fig. 1, spanning tree, see "computes alternating routing trees or paths" recited in column 2 lines 59-67 and column 3 lines 1-4).

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of McCanne by using the features, as taught by Haas et al., in order to provide determining a configuration of the overlay spanning tree having a maximum throughput among all possible configurations of the spanning tree given a reduced overlay distribution tree and until the configuration of the overlay spanning tree has the maximum throughput, protecting data delivery by link error recovery, re-determining the spanning tree upon determining that an existing node has left the spanning tree. The motivation of using these functions is to enhance the system in a cost effective manner.

McCanne and Haas et al. do not disclose the following features: regarding claim 1, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth and regarding claim 12, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth.

O'Toole et al. disclose a communication system for fast changing network status and load monitoring and feedback with the following features: claim 1, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth

(Fig. 5, an example of a network nodes, including groups of different nodes used for comparison by a new node that is establishing a relationship with the network, see "disconnecting the relationship with node 62E" recited in column 14 lines 57-62) and regarding claim 12, constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth (Fig. 5, an example of a network nodes, including groups of different nodes used for comparison by a new node that is establishing a relationship with the network, see "disconnecting the relationship with node 62E" recited in column 14 lines 57-62).

It would have been obvious to one of the ordinary skill in the art at the time of invention to modify the system of McCanne with Haas et al. by using the features, as taught by O'Toole et al., in order to provide constructing a reduced overlay distribution graph having a minimum available bandwidth greater than the target bandwidth by iteratively by removing an edge from the fully connected overlay distribution graph having a bandwidth less than or equal to the target bandwidth. The motivation of using these functions is to enhance the system in a cost effective manner.

6. Claims 3, 11, 14 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over McCanne (2003/0088696 A1) in view of Haas et al. (7,035,937 B2) and O'Toole et al. (US 7,185,077 B1) as applied to claims 1 and 12 above, and further in view of Silton et al. (USP 6,327,252).

McCanne, Haas et al. and O'Toole et al. described the claimed limitations as described in paragraph 5 above. McCanne, Haas et al. and O'Toole et al. do not disclose the following features: regarding claim 3, wherein the overlay spanning tree comprises a plurality of nodes and wherein the data delivery is reliable such that each node receives the same data; regarding claim 11, further comprising determining orphaned child nodes of the existing node that has left the spanning tree and performing a join for each orphaned child node; regarding claim 14, wherein the overlay spanning tree comprises a plurality of nodes and wherein the data delivery is reliable such that each node receives the same data and regarding claim 22, determining orphaned child nodes of the existing node that has left the spanning tree and performing a join for each orphaned child node.

Silton et al. discloses a communication system offering automatic link establishment between the distributed servers as members of overlay spanning tree with the following features: regarding claim 3, wherein the overlay spanning tree comprises a plurality of nodes (Fig. 1, distributed network, see "plurality of nodes" recited in column 2 lines 39-55) and wherein the data delivery is reliable such that each node receives the same data (Fig. 1, distributed network, see "shares processing workload" recited in column 2 lines 65-67 and column 3 line 1); regarding claim 11, further comprising: determining orphaned child nodes of the existing node that has left the spanning tree (Fig. 2, spanning tree, see "enters hunt mode" recited in column 3 lines 63-67 and column 4 lines 1-17) and performing a join for each orphaned child

node (Fig. 2, spanning tree, see "discovery mode" recited in column 3 lines 19-24 and lines 45-52) ; regarding claim 14, wherein the overlay spanning tree comprises a plurality of nodes (Fig. 1, distributed network, see "plurality of nodes" recited in column 2 lines 39-55) and wherein the data delivery is reliable such that each node receives the same data (Fig. 1, distributed network, see "shares processing workload" recited in column 2 lines 65-67 and column 3 line 1) and regarding claim 22, determining orphaned child nodes of the existing node that has left the spanning tree (Fig. 2, spanning tree, see "enters hunt mode" recited in column 3 lines 63-67 and column 4 lines 1-17) and performing a join for each orphaned child node (Fig. 2, spanning tree, see "discovery mode" recited in column 3 lines 19-24 and lines 45-52).

It would have been obvious to one of ordinary skill in the art at the time of invention to modify the system of McCanne with Haas et al. and O'Toole et al. by using the features, as taught by Sifton et al. in order to provide the overlay spanning tree comprises a plurality of nodes and wherein the data delivery is reliable such that each node receives the same data, determining orphaned child nodes of the existing node that has left the spanning tree and performing a join for each orphaned child node. The motivation of using these functions is to enhance the system in a cost effective manner.

7. Claims 7-9 and 18-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over McCanne (2003/0088696 A1) in view of Haas et al. (7,035,937 B2) and O'Toole et al. (US 7,185,077 B1) as applied to claim 1 and 8 above, and further in view of Hsu (USP 6,363,319 B1) and Grover et al. (US 2002/0187770 A1).

McCanne, Haas et al. and O'Toole et al. disclose claimed limitations as described in paragraphs 5 above. McCanne, Haas et al. and O'Toole et al. do not disclose the following features: regarding claim 8, comprising joining the new node to an existing node of the spanning tree and upon determining that the existing node has a bandwidth of greater than or equal to an existing rate and regarding claim 19, comprising joining the new node to an existing node of the spanning tree and upon determining that the existing node has a bandwidth of greater than or equal to an existing rate.

Hsu discloses a communication system for route selection in a computer network with the following features: regarding claim 8, comprising joining the new node to an existing node of the spanning tree (Fig. 7, process 700, see "provide admission control" recited in column 10 lines 10-13) and upon determining that the existing node has a bandwidth of greater than or equal to an existing rate (Fig. 7, process 700, see "determine the sum of the biased cost, step 720" recited in column 10 lines 13-21); regarding claim 19, comprising joining the new node to an existing node of the spanning tree (Fig. 7, process 700, see "provide admission control" recited in column 10 lines 10-13) and upon determining that the existing node has a bandwidth of greater than or equal to an existing rate (Fig. 7, process 700, see "determine the sum of the biased cost, step 720" recited in column 10 lines 13-21).

It would have been obvious to one of the ordinary skill in the art at the time of invention to modify the system of McCanne with Haas et al. and O'Toole et al. by using

the features, as taught by Hsu, in order to provide joining the new node to an existing node of the spanning tree and upon determining that the existing node has a bandwidth of greater than or equal to an existing rate. The motivation of using these functions is to enhance the system in a cost effective manner.

McCanne, Haas et al., O'Toole et al. and Hsu do not disclose the following features: regarding claim 7, further comprising joining a new node to the spanning tree; regarding claim 9, further comprising: determining a triangular improvement upon determining that no existing node has a bandwidth greater than or equal to the existing rate; joining the new node at an attachment point having a highest bandwidth among existing nodes of the spanning tree upon determining that the triangular improvement failed; and re-determining the spanning tree upon determining bandwidth less than or equal to a minimum threshold; regarding claim 18, further comprising joining a new node to the spanning tree and regarding claim 20, further comprising determining a triangular improvement upon determining that no existing node has a bandwidth greater than or equal to the existing rate; joining the new node at an attachment point having a highest bandwidth among existing nodes of the spanning tree upon determining that the triangular improvement failed; and re-determining the spanning tree upon determining bandwidth less than or equal to a minimum threshold.

Grover et al. disclose a topological design of survivable mesh-transport network with the following features: regarding claim 7, further comprising joining a new node to the spanning tree (Fig. 1, flow diagram showing the basic steps of the invention, see "move it to join a node on the other side of the cut" recited in paragraph 0016 lines 5-9

in the background of the invention); regarding claim 9, further comprising determining a triangular improvement upon determining that no existing node has a bandwidth greater than or equal to the existing rate (Fig. 1, flow diagram showing the basic steps of the invention, see "by detecting flow saturated cuts of the graph, the branch exchange process to discover effective exchanges in fewer iteration" recited in paragraph 0016 lines 1-5 in the background of the invention) joining the new node at an attachment point having a highest bandwidth among existing nodes of the spanning tree upon determining that the triangular improvement failed (Fig. 1, flow diagram showing the basic steps of the invention, see "it takes a lightly loaded link from the one side of the saturated cuts and move it to join a node on the other side of the cut" recited in paragraph 0016 lines 5-9 in the background of the invention), and re-determining the spanning tree upon determining bandwidth less than or equal to a minimum threshold (Fig. 1, flow diagram showing the basic steps of the invention, see "can be efficiently identified with a minimum spanning tree algorithm for link utilizations" recited in paragraph 0016 lines 9-12 in the background of the invention), regarding claim 18, further comprising joining a new node to the spanning tree (Fig. 1, flow diagram showing the basic steps of the invention, see "move it to join a node on the other side of the cut" recited in paragraph 0016 lines 5-9 in the background of the invention) and regarding claim 20, further comprising determining a triangular improvement upon determining that no existing node has a bandwidth greater than or equal to the existing rate (Fig. 1, flow diagram showing the basic steps of the invention, see "by detecting flow saturated cuts of the graph, the branch exchange process to discover effective

exchanges in fewer iteration" recited in paragraph 0016 lines 1-5 in the background of the invention); joining the new node at an attachment point having a highest bandwidth among existing nodes of the spanning tree upon determining that the triangular improvement failed (Fig. 1, flow diagram showing the basic steps of the invention, see "it takes a lightly loaded link from the one side of the saturated cuts and move it to join a node on the other side of the cut" recited in paragraph 0016 lines 5-9 in the background of the invention) and re-determining the spanning tree upon determining bandwidth less than or equal to a minimum threshold (Fig. 1, flow diagram showing the basic steps of the invention, see "can be efficiently identified with a minimum spanning tree algorithm for link utilizations" recited in paragraph 0016 lines 9-12 in the background of the invention).

It would have been obvious to one of the ordinary skill in the art at the time of invention to modify the system of McCanne with Haas et al., O'Toole et al. and Hsu by using the features, as taught by Grover et al., in order to provide joining a new node to the spanning tree, determining a triangular improvement upon determining that no existing node has a bandwidth greater than or equal to the existing rate, joining the new node at an attachment point having a highest bandwidth among existing nodes of the spanning tree upon determining that the triangular improvement failed and re-determining the spanning tree upon determining bandwidth less than or equal to a minimum threshold. The motivation of using these functions is to enhance the system in a cost effective manner.

***Response to Arguments***

6. Applicant's arguments with respect to claims 1-4, 7-15 and 18-22 have been considered but are moot in view of the new ground(s) of rejection.

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SYED BOKHARI whose telephone number is (571)270-3115. The examiner can normally be reached on Monday through Friday 8:00-17:00 Hrs..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kwang B. Yao can be reached on (571) 272-3182. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only.
